

What is ANZDATA?

- + ANZDATA helps hospitals learn whether patients are getting good dialysis or kidney transplant care.

- + ANZDATA is funded by the Australia and New Zealand governments and has been working since 1978.

- + ANZDATA is a data store of clinical information about all the people who have received a kidney transplant or been treated with dialysis in Australia and New Zealand.

- + The collection of treatment information involving thousands of people helps hospitals to learn about the health and wellbeing of those patients and ways to improve treatment.

Months

Years

START

END

- + Each year your hospital team collects routine information about ALL patients treated with dialysis or a transplant

- + This information is shared with a data center in Australia and combined with all patients in both countries

- + The ANZDATA team study the information to learn more about dialysis and transplant care

- + The ANZDATA team writes reports for hospitals each year about the care they provide

- + Hospitals and health systems aim to improve the care they give based on the ANZDATA information
